# End of Line Metal Detection

a *must* to address food safety and transparency issues

The best way to ensure no metal exists in your finished product is to use a metal-free Kwik Lok® closure or closure-label to complete your packing process. There are a number of other benefits to placing metal detection at the end of your packing line.

Bakeries are especially at risk because of the high speed at which they operate and slice their products. Many bread packages run through metal detection immediately after baking, but before slicing and closing. All the moving parts of a baking line moving at such high speeds can increase the possibility of small, but dangerous metal parts going undetected.

- Identify equipment issues
- Better adherence to new FSMA Guidelines
- Minimize customer rejections and returns
- Reducing injuries to your consumers and employees
